

What are Double Displacement Reactions?

Worksheet

A double displacement reaction exchanges ions between two compounds: $AB + CD \rightarrow AD + CB$. Example: $HCl + NaOH \rightarrow NaCl + HO$ (hydrogen and sodium ions swap partners, forming salt and water).

Questions

1. Which equation shows double displacement?

- A) $2H + O \rightarrow 2HO$
- B) $HCl + NaOH \rightarrow NaCl + HO$
- C) $Fe + CuSO_4 \rightarrow FeSO_4 + Cu$
- D) $CaCO_3 \rightarrow CaO + CO_2$

2. In $AB + CD \rightarrow AD + CB$, what happens?

- A) A combines with B
- B) Ions exchange partners
- C) One element replaces another
- D) One compound breaks apart

3. What often forms in double displacement?

- A) Only gases
- B) A precipitate, gas, or water
- C) Only heat
- D) No products

4. In $AgNO_3 + NaCl \rightarrow AgCl + NaNO_3$, the precipitate is

- A) $NaNO_3$
- B) $AgNO_3$
- C) $AgCl$
- D) $NaCl$

5. Hydrochloric acid (HCl) reacts with sodium hydroxide (NaOH). Ions exchange to form salt and water. Write and balance.

6. Sodium carbonate (Na_2CO_3) reacts with calcium chloride ($CaCl_2$). They form calcium carbonate precipitate and NaCl. Balance.

7. Silver nitrate ($AgNO_3$) reacts with sodium chloride ($NaCl$). They form $AgCl$ precipitate. Write and balance.

8. Define: What is a double displacement reaction?

9. Define: What often forms in double displacement?

10. Define: Is $HCl + NaOH \rightarrow NaCl + HO$ double displacement?

Answer Key

1. B) $\text{HCl} + \text{NaOH} \rightarrow \text{NaCl} + \text{HO}$ - $\text{HCl} + \text{NaOH} \rightarrow \text{NaCl} + \text{HO}$: H and Na ions exchange partners.
2. B) Ions exchange partners - Ions from the two compounds trade partners: A with D, B with C.
3. B) A precipitate, gas, or water - Double displacement often produces an insoluble precipitate, gas, or weakly molecular compound like water.
4. C) AgCl - AgCl (silver chloride) is insoluble in water and forms a white precipitate (indicates this).
5. Unbalanced: $\text{HCl} + \text{NaOH} \rightarrow \text{NaCl} + \text{HO}$ H: 1 on left, 2 on right (unbalanced) Cl: 1 on each side Na: 1 on each side O: 1 on each side Balance: equation already balanced as written (1:1:1:1) Balanced: $\text{HCl} + \text{NaOH} \rightarrow \text{NaCl} + \text{HO}$
6. Unbalanced: $\text{NaCO} + \text{CaCl} \rightarrow \text{CaCO} + \text{NaCl}$ Na: 2 on left, 1 on right (unbalanced) Ca: 1 on each side C: 1 on each side Cl: 2 on left, 1 on right (unbalanced) Balance: need 2 NaCl on right Balanced: $\text{NaCO} + \text{CaCl} \rightarrow \text{CaCO} + 2\text{NaCl}$
7. Unbalanced: $\text{AgNO} + \text{NaCl} \rightarrow \text{AgCl} + \text{NaNO}$ Ag: 1 on each side N: 1 on each side Cl: 1 on each side Na: 1 on each side O: 3 on each side Balanced: $\text{AgNO} + \text{NaCl} \rightarrow \text{AgCl} + \text{NaNO}$
8. Ions from two compounds exchange places: $\text{AB} + \text{CD} \rightarrow \text{AD} + \text{CB}$. Two new compounds form.
9. A gas, a precipitate (solid), or water - one of the products is often insoluble or weakly molecular.
10. Yes. H and Na ions swap partners. This is an acid-base neutralization (a type of double displacement).
