

# What is a Rate Law and Reaction Order?

## Worksheet

Rate law:  $\text{rate} = k[\text{A}]^m[\text{B}]^n$ , where  $k$  is the rate constant and  $m, n$  are the reaction orders. Orders are determined experimentally, not from stoichiometry.

$$\text{rate} = k[\text{A}]^m[\text{B}]^n$$

## Questions

1. For  $\text{rate} = 0.1[\text{A}]^2[\text{B}]$ , if  $[\text{A}] = 2 \text{ M}$  and  $[\text{B}] = 1 \text{ M}$ , rate?

- A) 0.1
- B) 0.2
- C) 0.4
- D) 0.8

2. Tripling  $[\text{A}]$  increases rate 9. Reaction order in  $\text{A}$ ?

- A) 0 (zero)
- B) 1 (first)
- C) 2 (second)
- D) 3 (third)

3. Which is determined experimentally?

- A) Rate constant  $k$  only
- B) Reaction order only
- C) Both  $k$  and order
- D) Stoichiometry

4. For a zero-order reaction, doubling  $[\text{A}]$

- A) Doubles rate
- B) Quadruples rate
- C) No effect
- D) Halves rate

5. For a reaction  $\text{rate} = k[\text{A}][\text{B}]$ , with  $k = 0.5 \text{ M}^{-1}\text{s}^{-1}$ ,  $[\text{A}] = 2 \text{ M}$ ,  $[\text{B}] = 0.3 \text{ M}$ , find the rate.

6. A decomposition follows  $\text{rate} = k[\text{A}]^2$  with  $k = 0.02 \text{ M}^{-1}\text{s}^{-1}$  and  $[\text{A}] = 1.5 \text{ M}$ . Rate?

7. If doubling  $[\text{A}]$  quadruples the rate, what is the reaction order with respect to  $\text{A}$ ?

8. Define: What is a rate law?

9. Define: What is reaction order?

10. Define: What is the rate constant  $k$ ?

## Answer Key

1. C)  $0.4 - \text{rate} = 0.1 (2)^2 1 = 0.1 \cdot 4 = 0.4 \text{ mol/(Ls)}$ .
2. C) 2 (second) -  $3^m = 9 \Rightarrow m = 2$  (second order).
3. C) Both k and order - Both k and orders come from experiment, not from the balanced equation.
4. C) No effect -  $\text{rate} = k[A]^0 = k$  (constant), independent of [A].
5.  $\text{rate} = k[A][B]$   $\text{rate} = 0.5 \cdot 2 \cdot 0.3$   $\text{rate} = 0.3 \text{ mol/(Ls)}$
6.  $\text{rate} = k[A]^2$   $\text{rate} = 0.02 (1.5)^2$   $\text{rate} = 0.02 \cdot 2.25 = 0.045 \text{ mol/(Ls)}$
7. If  $\text{rate} [A]^m$ , and  $2[A]$   $4 \text{ rate}$  Then  $2^m = 4$   $2^m = 2^2$ , so  $m = 2$  The reaction is second order in A.
8. A mathematical expression relating rate to concentrations:  $\text{rate} = k[A]^m[B]^n$ .
9. The exponent of concentration in the rate law; determined experimentally, not from stoichiometry.
10. A proportionality constant unique to a reaction at a given temperature; units depend on overall order.
