

What are Synthesis Reactions?

Worksheet

A synthesis reaction combines two or more reactants into one product: $A + B \rightarrow AB$. Common examples include burning hydrogen ($2H_2 + O_2 \rightarrow 2H_2O$) and reacting sodium with chlorine ($2Na + Cl_2 \rightarrow 2NaCl$).

Questions

1. Which equation is a synthesis reaction?

- A) $2H_2O \rightarrow 2H_2 + O_2$
- B) $2Na + Cl_2 \rightarrow 2NaCl$
- C) $HCl + NaOH \rightarrow NaCl + HO$
- D) $CHO \rightarrow 2CHO + 2CO$

2. What is the general form of synthesis?

- A) $A + B \rightarrow C$
- B) $A + B \rightarrow AB$
- C) $AB + CD \rightarrow AD + CB$
- D) $A + BC \rightarrow AC + B$

3. Is $2H_2 + O_2 \rightarrow 2H_2O$ synthesis?

- A) No, it is decomposition
- B) Yes, two reactants form one product
- C) No, it is single displacement
- D) No, it is double displacement

4. When iron (Fe) burns in oxygen, it forms FeO. This is synthesis because

- A) one reactant breaks down
- B) two reactants combine into one product
- C) atoms switch places
- D) ions exchange partners

5. Sodium (Na) reacts with chlorine gas (Cl₂) to form sodium chloride. Write and balance the equation.

6. Hydrogen gas (H₂) burns in oxygen (O₂) to form water (H₂O). Balance this synthesis reaction.

7. Carbon (C) burns completely in oxygen to form carbon dioxide. Write the balanced synthesis equation.

8. Define: What is a synthesis reaction?

9. Define: Is burning a synthesis reaction?

10. Define: Give an example of synthesis.

Answer Key

1. B) $2\text{Na} + \text{Cl}_2 \rightarrow 2\text{NaCl}$ - $2\text{Na} + \text{Cl}_2 \rightarrow 2\text{NaCl}$ combines two reactants into one product.
2. B) $\text{A} + \text{B} \rightarrow \text{AB}$ - Synthesis: $\text{A} + \text{B} \rightarrow \text{AB}$ (two or more combine into one).
3. B) Yes, two reactants form one product - Two substances (hydrogen and oxygen) combine to form one product (water).
4. B) two reactants combine into one product - Fe and O (two reactants) combine to form FeO (one product).
5. Unbalanced: $\text{Na} + \text{Cl}_2 \rightarrow \text{NaCl}$ Balance Cl: need 2 NaCl on right Balance Na: need 2 Na on left Balanced: $2\text{Na} + \text{Cl}_2 \rightarrow 2\text{NaCl}$
6. Unbalanced: $\text{H}_2 + \text{O}_2 \rightarrow \text{H}_2\text{O}$ Balance O: need 2 H_2O on right Balance H: need 2 H_2 on left Balanced: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$
7. Unbalanced: $\text{C} + \text{O}_2 \rightarrow \text{CO}$ Carbon: 1 on left, 1 on right Oxygen: 2 on left, 2 on right Balanced: $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$
8. A reaction where two or more reactants combine to form a single product: $\text{A} + \text{B} \rightarrow \text{AB}$.
9. Yes. For example, hydrogen burns in oxygen to form water: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$.
10. Sodium reacting with chlorine: $2\text{Na} + \text{Cl}_2 \rightarrow 2\text{NaCl}$ (sodium chloride).
